|                                                                      |           |
|----------------------------------------------------------------------|-----------|
| <b>1. Installing Arduino IDE .....</b>                               | <b>1</b>  |
| Introduction.....                                                    | 1         |
| Structure.....                                                       | 2         |
| Objectives.....                                                      | 2         |
| Recipe 1: Arduino and its usage .....                                | 2         |
| <i>Advantages of Arduino board.....</i>                              | <i>3</i>  |
| <i>Different Arduino boards.....</i>                                 | <i>4</i>  |
| <i>Features of Arduino Uno R3 .....</i>                              | <i>4</i>  |
| Recipe 2: Installing Arduino IDE.....                                | 5         |
| <i>Offline IDE Installation for desktop environments .....</i>       | <i>5</i>  |
| Recipe 3: Connecting Arduino board to the computer .....             | 8         |
| Recipe 4: Uploading a sample code on the Arduino board.....          | 10        |
| <i>Troubleshooting in the uploading process.....</i>                 | <i>12</i> |
| <i>Compilation-related errors.....</i>                               | <i>13</i> |
| <i>Uploading related errors.....</i>                                 | <i>14</i> |
| Recipe 5: Adding and accessing a new library in Arduino sketch ..... | 14        |
| <i>Accessing a pre-installed library .....</i>                       | <i>15</i> |
| <i>Installing new libraries from the library manager .....</i>       | <i>15</i> |
| <i>Installing a library from a .zip file.....</i>                    | <i>17</i> |
| Conclusion.....                                                      | 17        |
| Points to remember .....                                             | 18        |
| Multiple choice questions.....                                       | 18        |
| <i>Answers .....</i>                                                 | <i>19</i> |
| <b>2. C Programming Basic .....</b>                                  | <b>21</b> |
| Introduction.....                                                    | 21        |
| Structure.....                                                       | 21        |
| Objectives.....                                                      | 22        |

|                                                                                 |           |
|---------------------------------------------------------------------------------|-----------|
| Recipe 1: Creating and saving your first Arduino sketch.....                    | 22        |
| <i>Structuring of an Arduino sketch</i> .....                                   | 22        |
| <i>Writing the first Arduino sketch</i> .....                                   | 23        |
| Recipe 2: Understanding different functions of Arduino programming.....         | 24        |
| Recipe 3: Understanding variables in programming .....                          | 26        |
| <i>Constants</i> .....                                                          | 26        |
| <i>Boolean constants (true and false)</i> .....                                 | 26        |
| <i>Pin Levels: HIGH and LOW</i> .....                                           | 26        |
| <i>Data types</i> .....                                                         | 26        |
| Recipe 4: Display on serial monitor .....                                       | 27        |
| <i>Setting up serial communication and printing on the serial monitor</i> ..... | 28        |
| Recipe 5: Perform simple arithmetic operations in a sketch .....                | 30        |
| <i>A simple addition</i> .....                                                  | 30        |
| <i>More operations</i> .....                                                    | 31        |
| Recipe 6: Accessing different types of pins on Arduino .....                    | 32        |
| <i>Power, digital and analog</i> .....                                          | 33        |
| PWM pins .....                                                                  | 35        |
| <i>Serial communication pins</i> .....                                          | 36        |
| <i>SPI and I2C pins</i> .....                                                   | 38        |
| <i>Interrupt pins</i> .....                                                     | 40        |
| Recipe 7: Convert a number into a string.....                                   | 40        |
| Conclusion.....                                                                 | 41        |
| Points to remember .....                                                        | 42        |
| Multiple choice questions.....                                                  | 42        |
| <i>Answers</i> .....                                                            | 43        |
| <b>3. Advanced Programming Construct.....</b>                                   | <b>45</b> |
| Introduction.....                                                               | 45        |
| Structure.....                                                                  | 45        |
| Objectives.....                                                                 | 46        |

|                                                                                     |           |
|-------------------------------------------------------------------------------------|-----------|
| Recipe 1: Performing different actions based on two different variable values ..... | 46        |
| Recipe 2: Performing multiple actions based on multiple values of a variable.....   | 48        |
| Recipe 3: Repeating an action a fixed number of times .....                         | 50        |
| Recipe 4: Repeating an action till another event occurs.....                        | 51        |
| Recipe 5: Grouping and splitting different variables .....                          | 52        |
| Recipe 6: Splitting text from a group .....                                         | 54        |
| Recipe 7: Interrupting an ongoing event with another event .....                    | 55        |
| Recipe 8: Generating different tones using Arduino uno .....                        | 57        |
| Recipe 9: Changing the intensity of an LED .....                                    | 58        |
| Recipe 10: Sending binary values through serial communication .....                 | 59        |
| Recipe 11: Taking multiple decisions using case statements.....                     | 60        |
| Recipe 12: Generate the knight rider sequence using 7 LEDs.....                     | 62        |
| Recipe 13: Controlling 5 different LEDs using serial communication through PC.....  | 63        |
| Conclusion.....                                                                     | 66        |
| Points to remember .....                                                            | 66        |
| Multiple choice questions.....                                                      | 66        |
| <i>Answers</i> .....                                                                | 68        |
| <b>4. Switches and Displays .....</b>                                               | <b>69</b> |
| Introduction.....                                                                   | 69        |
| Structure.....                                                                      | 70        |
| Objectives.....                                                                     | 70        |
| Recipe 1: Reading different voltage values from a switch.....                       | 70        |
| Recipe 2: Calculating the time for which a pushbutton is pressed .....              | 72        |
| Recipe 3: Generating red, green, and blue colors using an RGB LED .....             | 74        |
| Recipe 4: Generating millions of random colors using RGB LED.....                   | 76        |
| Recipe 5: Driving a 7-segment LED display .....                                     | 78        |
| Recipe 6: Displaying a blinking message on a 16x2 LCD .....                         | 85        |
| Recipe 7: Displaying a left scrolling message on a 16x2 LCD .....                   | 87        |

|                                                                                                        |           |
|--------------------------------------------------------------------------------------------------------|-----------|
| Recipe 8: Displaying a rotating sequence using a NeoPixel LED.....                                     | 89        |
| Recipe 9: Generating different voltage values using a<br>potentiometer and display them on an LCD..... | 91        |
| Recipe 10: Design a 6-level water level indicator using an LED array .....                             | 93        |
| Conclusion .....                                                                                       | 94        |
| Points to remember .....                                                                               | 95        |
| Multiple choice questions.....                                                                         | 95        |
| <i>Answers</i> .....                                                                                   | 96        |
| <b>5. Sensor Integration With Arduino .....</b>                                                        | <b>97</b> |
| Introduction.....                                                                                      | 97        |
| Structure.....                                                                                         | 98        |
| Objectives.....                                                                                        | 98        |
| Recipe 1: Detecting the intensity of light.....                                                        | 98        |
| Recipe 2: Detecting the object with an IR proximity sensor.....                                        | 101       |
| Recipe 3: Measuring the distance of a wall from the sensor .....                                       | 103       |
| Recipe 4: Clap-controlled home appliance .....                                                         | 105       |
| Recipe 5: Designing a water level indicator by measuring<br>the depth of the water level.....          | 107       |
| Recipe 6: Detecting the LPG leakage in a home .....                                                    | 111       |
| Recipe 7: Detect the motion of a person around your home.....                                          | 113       |
| Recipe 8: Design a robust burglar alarm system.....                                                    | 114       |
| Recipe 9: Securing access to a door using a 4-digit password .....                                     | 118       |
| Recipe 10: Designing a multi-password door lock .....                                                  | 121       |
| Recipe 11: Designing a reverse car parking assistant system.....                                       | 124       |
| Recipe 12: Measuring the temperature of the surroundings.....                                          | 126       |
| Recipe 13: Designing a digital weather station to show<br>real-time weather conditions .....           | 128       |
| Conclusion .....                                                                                       | 133       |
| Points to remember .....                                                                               | 133       |
| Multiple Choice Questions.....                                                                         | 134       |
| <i>Answers</i> .....                                                                                   | 136       |

|                                                                                       |            |
|---------------------------------------------------------------------------------------|------------|
| <b>6. Motor Control Using Arduino.....</b>                                            | <b>137</b> |
| Introduction.....                                                                     | 137        |
| Structure.....                                                                        | 138        |
| Objectives.....                                                                       | 138        |
| Recipe 1: Connecting DC hobby motors to an Arduino.....                               | 139        |
| Recipe 2: Controlling the direction of a hobby motor.....                             | 140        |
| Recipe 3: Driving a 5 Volt DC motor using Arduino with L293D.....                     | 142        |
| Recipe 4: Controlling the speed of a motor using PWM.....                             | 144        |
| Recipe 5: Driving a 12 Volts DC motor using Arduino.....                              | 145        |
| Recipe 6: Designing a 2-wheel drive (2WD) robot.....                                  | 147        |
| Recipe 7: Designing an obstacle avoider robot with Arduino .....                      | 148        |
| Recipe 8: Designing a line following robot to run on a black line.....                | 151        |
| Recipe 9: Controlling the angle of movement of a servo motor .....                    | 154        |
| Recipe 10: Controlling the movements of a servo with a potentiometer ..               | 156        |
| Recipe 11: A smart dustbin that opens the lid on detecting a<br>person around it..... | 158        |
| Recipe 12: Automated parking boom barrier .....                                       | 160        |
| Recipe 13: Designing a robotic hand to pick a glass of water .....                    | 161        |
| Recipe 14: Controlling a stepper motor with Arduino.....                              | 164        |
| Recipe 15: Controlling a DC motor with an encoder with Arduino .....                  | 166        |
| Conclusion.....                                                                       | 169        |
| Points to remember .....                                                              | 170        |
| Multiple choice questions.....                                                        | 170        |
| <i>Answers</i> .....                                                                  | 170        |
| <b>7. I2C and SPI Communication.....</b>                                              | <b>171</b> |
| Introduction.....                                                                     | 171        |
| Structure.....                                                                        | 171        |
| Objectives.....                                                                       | 172        |
| Recipe 1: Connect two Arduino boards to set up I2C communication.....                 | 172        |
| Recipe 2: Connecting I2C adapter to Arduino.....                                      | 176        |

|                                                                                            |            |
|--------------------------------------------------------------------------------------------|------------|
| Recipe 3: Controlling a 16x2 LCD with I2C protocol .....                                   | 178        |
| Recipe 4: Displaying data on an OLED screen.....                                           | 181        |
| Recipe 5: Digital voltmeter design using Arduino .....                                     | 185        |
| Recipe 6: Understanding SPI communication on an Arduino board.....                         | 187        |
| Recipe 7: Communicate between two Arduino boards using<br>SPI communication.....           | 189        |
| Conclusion.....                                                                            | 193        |
| Points to remember .....                                                                   | 194        |
| Multiple choice questions.....                                                             | 194        |
| <i>Answers</i> .....                                                                       | 195        |
| <b>8. CAN Bus Communication .....</b>                                                      | <b>197</b> |
| Introduction.....                                                                          | 197        |
| Structure.....                                                                             | 197        |
| Objectives.....                                                                            | 198        |
| Recipe 1: Using CAN protocol with Arduino.....                                             | 198        |
| Recipe 2: Setting up the MCP2515 module with an Arduino .....                              | 200        |
| Recipe 3: Send temperature sensor data over the CAN.....                                   | 203        |
| Conclusion.....                                                                            | 208        |
